Space Technology Accelerator: new ideas for life on Earth

Commercialising the wonders of space

Expleo is working with our partners in the space sector to engineer the next era of space technology, with a focus on satellite design, space data management and next-gen industrial processes and ground systems equipment.

Expleo's Space Technology Accelerator identifies downstream opportunities to cross-fertilise innovation into the other sectors in which we operate. Our dedicated team experiments rapidly at a small scale to prove how concepts and technologies fit within industrial use cases. Successful projects will ultimately scale up into commercial contracts that benefit humanity around the world.

Where we can help

**Earth
observation**

**Satellite
communication**

Partner with Expleo to...

Detect and discover
new business territories

Accelerate technological innovation
at small scale to assess technical issues, products and services

Scale innovations into commercial contracts
to turn your innovations into revenue

Attract government and private funding
with access to our expertise and investment networks

Do you have a business demand that might benefit from space technology?
Or even have a new concept, inspired by space technology, which needs funding?

Get in touch today to find out how we can help.

Our work so far...

Fast-track innovation in space

Bringing together a team of engineers driven by space ventures was key to building Expleo's newSpace capability. Expleo developed a team capable of handling a nanosatellite payload design and production. Now being familiar with traditional space standards as well as newSpace philosophy, we are now targeting timescales of months from idea to launch of payloads.

The idea behind these developments and key partnerships is to provide enhanced benefits to our customers when delivering our expertise in engineering services throughout industries. Having customers in many different fields allows our engineers to have cross-fertilisation at the center of our processes. For instance, we use our knowledge on industrialisation in the automotive and manufacturing sectors to provide a relevant approach towards a newSpace Agile Factory that will speed up the access to space.

Engineering the next space era

From satellite design to space data management, through next-gen ground systems equipment, Expleo develops and tests new products and services that are scalable, smarter and more sustainable. With our partners, we bring the wonders of space to the world, connecting the possibilities of space with life on Earth.

Expleo can help you across the lifecycle:

- Satellite payload and satellite application
- Launching activities
- Enabling complex system interoperability

Think bold, act reliable
